

---

# **Association Rule Mining**

Dr. Faisal Kamiran

# Association Rule Mining

- Given a set of transactions, find rules that will predict the occurrence of an item based on the occurrences of other items in the transaction

## Market-Basket transactions

<i>TID</i>	<i>Items</i>
1	Bread, Milk
2	Bread, Diaper, Beer, Eggs
3	Milk, Diaper, Beer, Coke
4	Bread, Milk, Diaper, Beer
5	Bread, Milk, Diaper, Coke

## Example of Association Rules

$\{\text{Diaper}\} \rightarrow \{\text{Beer}\},$   
 $\{\text{Milk, Bread}\} \rightarrow \{\text{Eggs, Coke}\},$   
 $\{\text{Beer, Bread}\} \rightarrow \{\text{Milk}\},$

Implication means co-occurrence,  
not causality!

# Definition: Frequent Itemset

- **Itemset**

- A collection of one or more items
  - ◆ Example: {Milk, Bread, Diaper}
- k-itemset
  - ◆ An itemset that contains k items

- **Support count ( $\sigma$ )**

- Frequency of occurrence of an itemset
- E.g.  $\sigma(\{\text{Milk, Bread, Diaper}\}) = 2$

- **Support**

- Fraction of transactions that contain an itemset
- E.g.  $s(\{\text{Milk, Bread, Diaper}\}) = 2/5$

- **Frequent Itemset**

- An itemset whose support is greater than or equal to a *minsup* threshold

<i>TID</i>	<i>Items</i>
1	Bread, Milk
2	Bread, Diaper, Beer, Eggs
3	Milk, Diaper, Beer, Coke
4	Bread, Milk, Diaper, Beer
5	Bread, Milk, Diaper, Coke

# Definition: Association Rule

- **Association Rule**

- An implication expression of the form  $X \rightarrow Y$ , where  $X$  and  $Y$  are itemsets
- Example:  
 $\{\text{Milk, Diaper}\} \rightarrow \{\text{Beer}\}$

- **Rule Evaluation Metrics**

- Support (s)
  - ◆ Fraction of transactions that contain both  $X$  and  $Y$
- Confidence (c)
  - ◆ Measures how often items in  $Y$  appear in transactions that contain  $X$

<i>TID</i>	<i>Items</i>
1	Bread, Milk
2	Bread, Diaper, Beer, Eggs
3	Milk, Diaper, Beer, Coke
4	Bread, Milk, Diaper, Beer
5	Bread, Milk, Diaper, Coke

Example:

$\{\text{Milk, Diaper}\} \Rightarrow \text{Beer}$

$$s = \frac{\sigma(\text{Milk, Diaper, Beer})}{|T|} = \frac{2}{5} = 0.4$$

$$c = \frac{\sigma(\text{Milk, Diaper, Beer})}{\sigma(\text{Milk, Diaper})} = \frac{2}{3} = 0.67$$

# Association Rule Mining Task

---

- Given a set of transactions  $T$ , the goal of association rule mining is to find all rules having
  - support  $\geq$  *minsup* threshold
  - confidence  $\geq$  *minconf* threshold
- Brute-force approach:
  - List all possible association rules
  - Compute the support and confidence for each rule
  - Prune rules that fail the *minsup* and *minconf* thresholds

⇒ **Computationally prohibitive!**

# Mining Association Rules

<i>TID</i>	<i>Items</i>
1	Bread, Milk
2	Bread, Diaper, Beer, Eggs
3	Milk, Diaper, Beer, Coke
4	Bread, Milk, Diaper, Beer
5	Bread, Milk, Diaper, Coke

## Example of Rules:

$\{\text{Milk, Diaper}\} \rightarrow \{\text{Beer}\}$  ( $s=0.4$ ,  $c=0.67$ )  
 $\{\text{Milk, Beer}\} \rightarrow \{\text{Diaper}\}$  ( $s=0.4$ ,  $c=1.0$ )  
 $\{\text{Diaper, Beer}\} \rightarrow \{\text{Milk}\}$  ( $s=0.4$ ,  $c=0.67$ )  
 $\{\text{Beer}\} \rightarrow \{\text{Milk, Diaper}\}$  ( $s=0.4$ ,  $c=0.67$ )  
 $\{\text{Diaper}\} \rightarrow \{\text{Milk, Beer}\}$  ( $s=0.4$ ,  $c=0.5$ )  
 $\{\text{Milk}\} \rightarrow \{\text{Diaper, Beer}\}$  ( $s=0.4$ ,  $c=0.5$ )

## Observations:

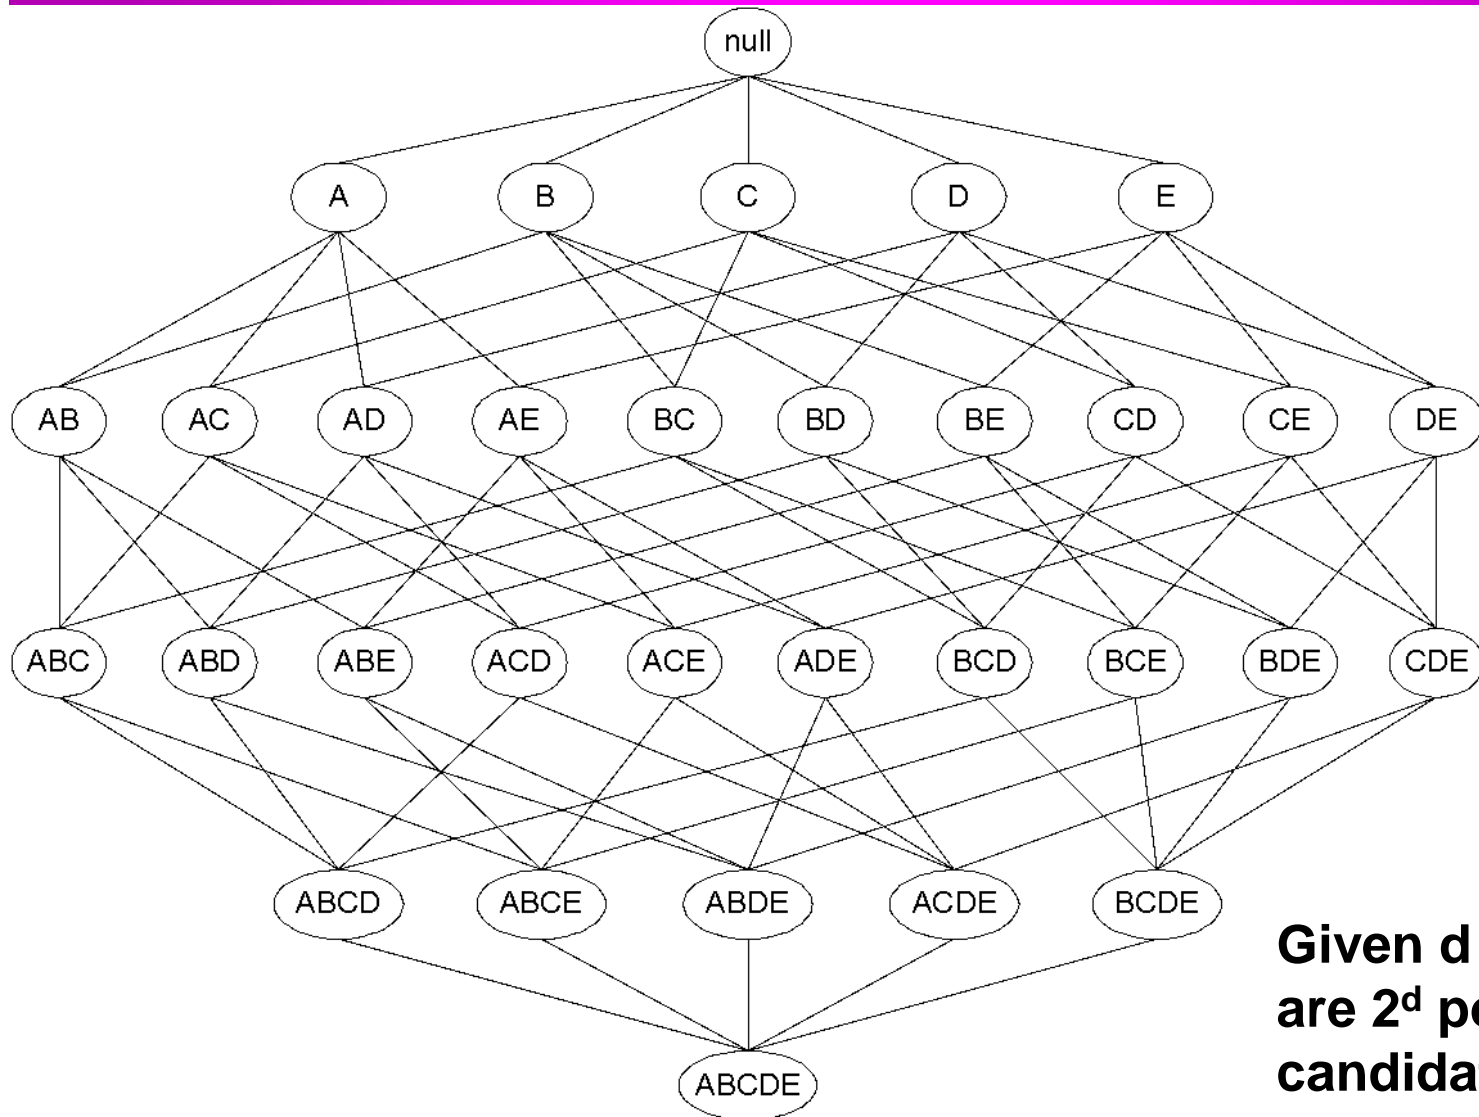

- All the above rules are binary partitions of the same itemset:  
 $\{\text{Milk, Diaper, Beer}\}$
- Rules originating from the same itemset have identical support but can have different confidence
- Thus, we may decouple the support and confidence requirements

# Mining Association Rules

---

- Two-step approach:
  1. Frequent Itemset Generation
    - Generate all itemsets whose support  $\geq$  minsup
  2. Rule Generation
    - Generate high confidence rules from each frequent itemset, where each rule is a binary partitioning of a frequent itemset
- Frequent itemset generation is still computationally expensive

# Frequent Itemset Generation

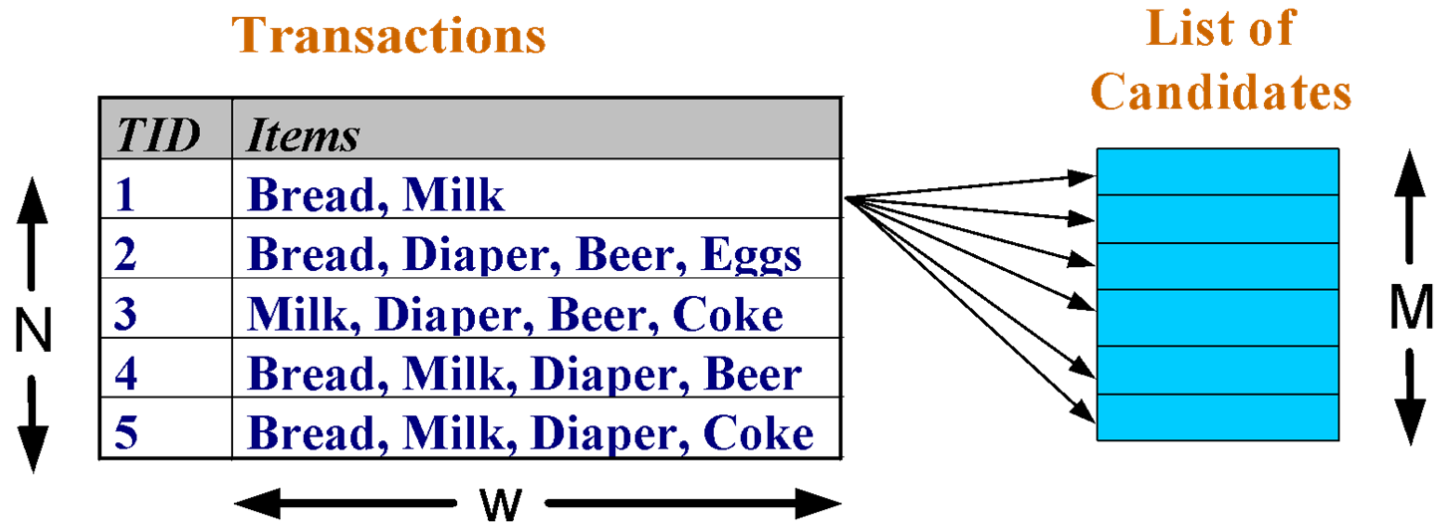

**Given d items, there are  $2^d$  possible candidate itemsets**

# Frequent Itemset Generation

- Brute-force approach:
  - Each itemset in the lattice is a **candidate** frequent itemset
  - Count the support of each candidate by scanning the database

- Match each transaction against every candidate
- Complexity  $\sim O(NMw) \Rightarrow$  **Expensive since  $M = 2^d$  !!!**

# Computational Complexity

- Given  $d$  unique items:
  - Total number of itemsets =  $2^d$
  - Total number of possible association rules:

$$= 3^d - 2^{d+1} + 1$$

**If  $d=6$ ,  $R = 602$  rules**

# Frequent Itemset Generation Strategies

---

- Reduce the **number of candidates** (M)
  - Complete search:  $M=2^d$
  - Use pruning techniques to reduce M
- Reduce the **number of transactions** (N)
  - Reduce size of N as the size of itemset increases
  - Used by DHP and vertical-based mining algorithms
- Reduce the **number of comparisons** (NM)
  - Use efficient data structures to store the candidates or transactions
  - No need to match every candidate against every transaction

# Reducing Number of Candidates

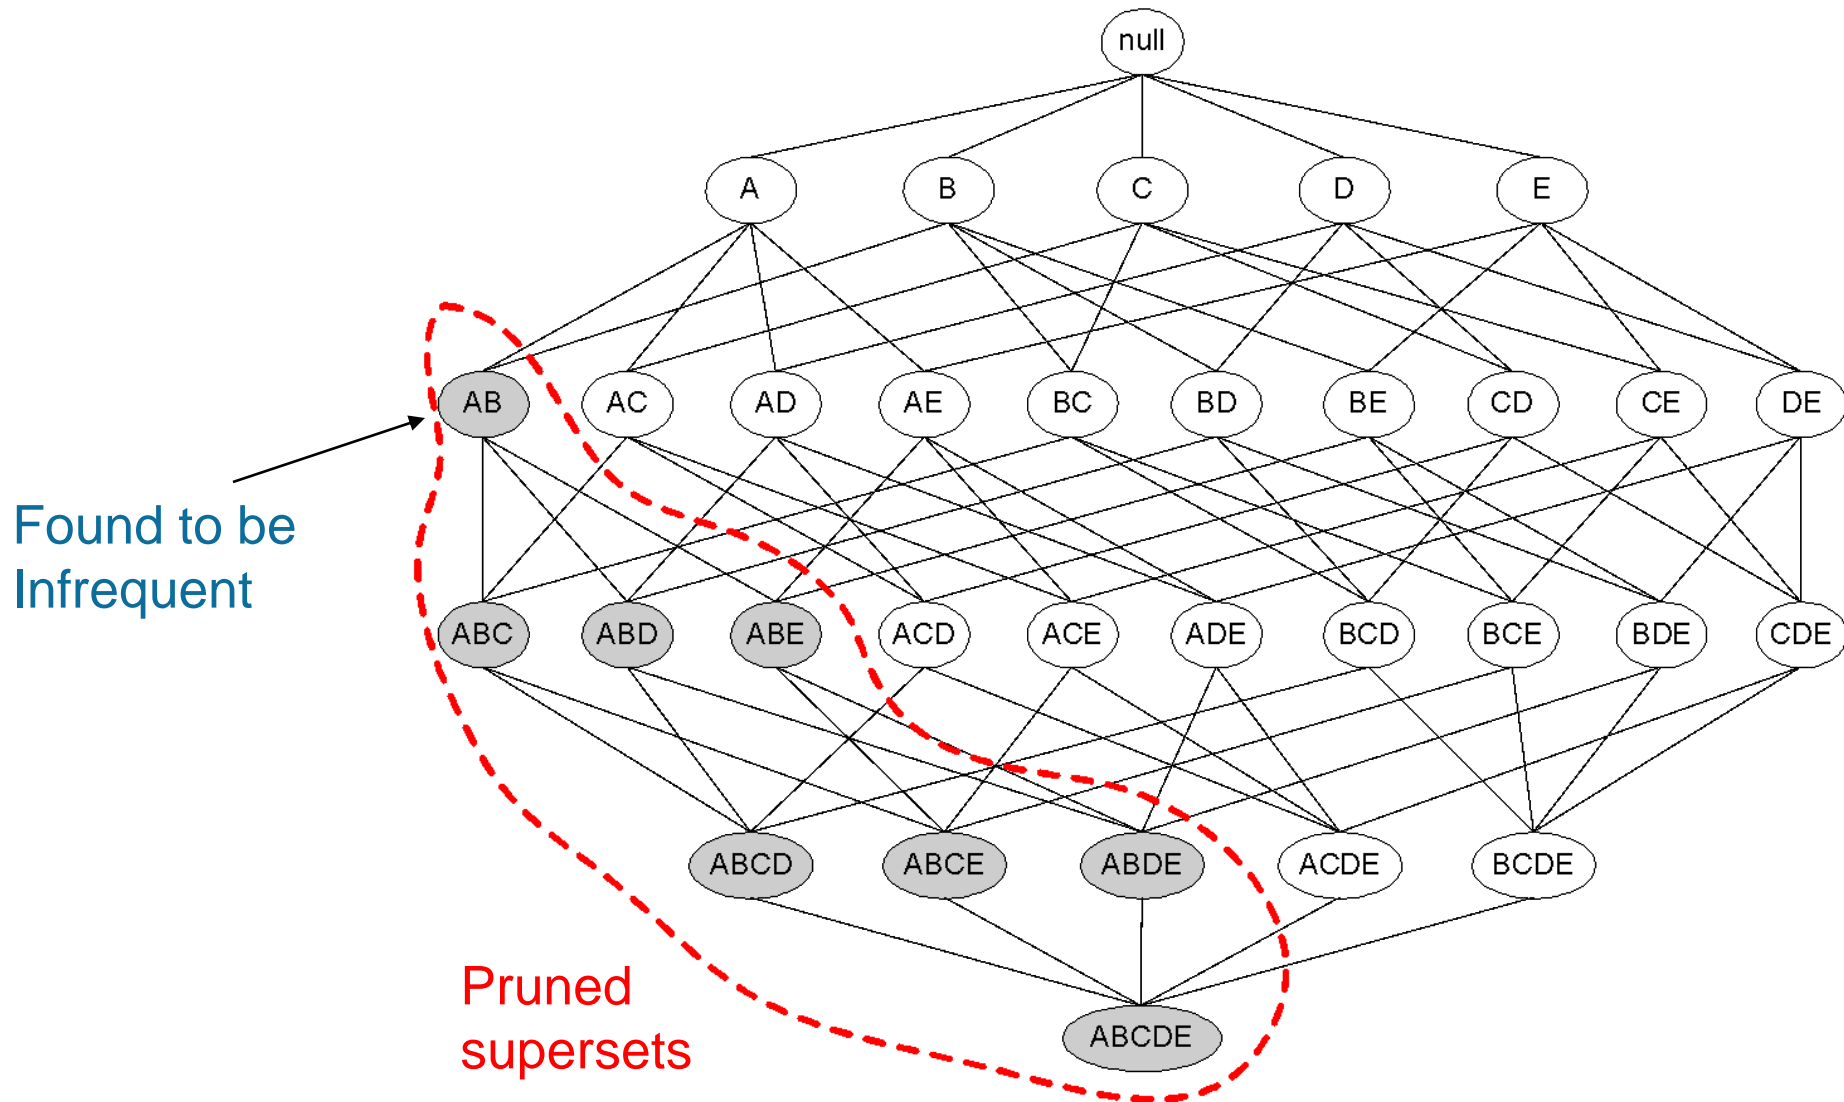

---

- **Apriori principle:**
  - If an itemset is frequent, then all of its subsets must also be frequent
- Apriori principle holds due to the following property of the support measure:

$$\forall X, Y : (X \subseteq Y) \Rightarrow s(X) \geq s(Y)$$

- Support of an itemset never exceeds the support of its subsets
- This is known as the **anti-monotone** property of support

# Illustrating Apriori Principle

# Illustrating Apriori Principle

Item	Count
Bread	4
Coke	2
Milk	4
Beer	3
Diaper	4
Eggs	1

Items (1-itemsets)

Itemset	Count
{Bread,Milk}	3
{Bread,Beer}	2
{Bread,Diaper}	3
{Milk,Beer}	2
{Milk,Diaper}	3
{Beer,Diaper}	3

Pairs (2-itemsets)

(No need to generate candidates involving Coke or Eggs)

Minimum Support = 3

If every subset is considered,  
 ${}^6C_1 + {}^6C_2 + {}^6C_3 = 41$   
With support-based pruning,  
 $6 + 6 + 1 = 13$

Itemset	Count
{Bread,Milk,Diaper}	3

Triplets (3-itemsets)

What about {**Beer**, Diaper, **Milk**} ?  
And, {Bread, **Milk**, **Beer**}?  
And, {**Bread**, Diaper, **Beer**}?

# Apriori Algorithm

---

- Method:
  - Let  $k=1$
  - Generate frequent itemsets of length 1
  - Repeat until no new frequent itemsets are identified
    - ◆ Generate length  $(k+1)$  candidate itemsets from length  $k$  frequent itemsets
    - ◆ Count the support of each candidate by scanning the DB
    - ◆ Eliminate candidates that are infrequent, leaving only those that are frequent

# ECLAT

- For each item, store a list of transaction ids (tids)

Horizontal  
Data Layout

TID	Items
1	A,B,E
2	B,C,D
3	C,E
4	A,C,D
5	A,B,C,D
6	A,E
7	A,B
8	A,B,C
9	A,C,D
10	B

Vertical Data Layout

A	B	C	D	E
1	1	2	2	1
4	2	3	4	3
5	5	4	5	6
6	7	8	9	
7	8	9		
8	10			
9				

# ECLAT

- Determine support of any k-itemset by intersecting tid-lists of two of its (k-1) subsets.

- 3 traversal approaches:
  - top-down, bottom-up and hybrid
- Advantage: very fast support counting
- Disadvantage: intermediate tid-lists may become too large for memory

# Rule Generation

- Given a frequent itemset  $L$ , find all non-empty subsets  $f \subset L$  such that  $f \rightarrow L - f$  satisfies the minimum confidence requirement
  - If  $\{A,B,C,D\}$  is a frequent itemset, candidate rules:  

$ABC \rightarrow D,$	$ABD \rightarrow C,$	$ACD \rightarrow B,$	$BCD \rightarrow A,$
$A \rightarrow BCD,$	$B \rightarrow ACD,$	$C \rightarrow ABD,$	$D \rightarrow ABC$
$AB \rightarrow CD,$	$AC \rightarrow BD,$	$AD \rightarrow BC,$	$BC \rightarrow AD,$
$BD \rightarrow AC,$	$CD \rightarrow AB,$		
- If  $|L| = k$ , then there are  $2^k - 2$  candidate association rules (ignoring  $L \rightarrow \emptyset$  and  $\emptyset \rightarrow L$ )

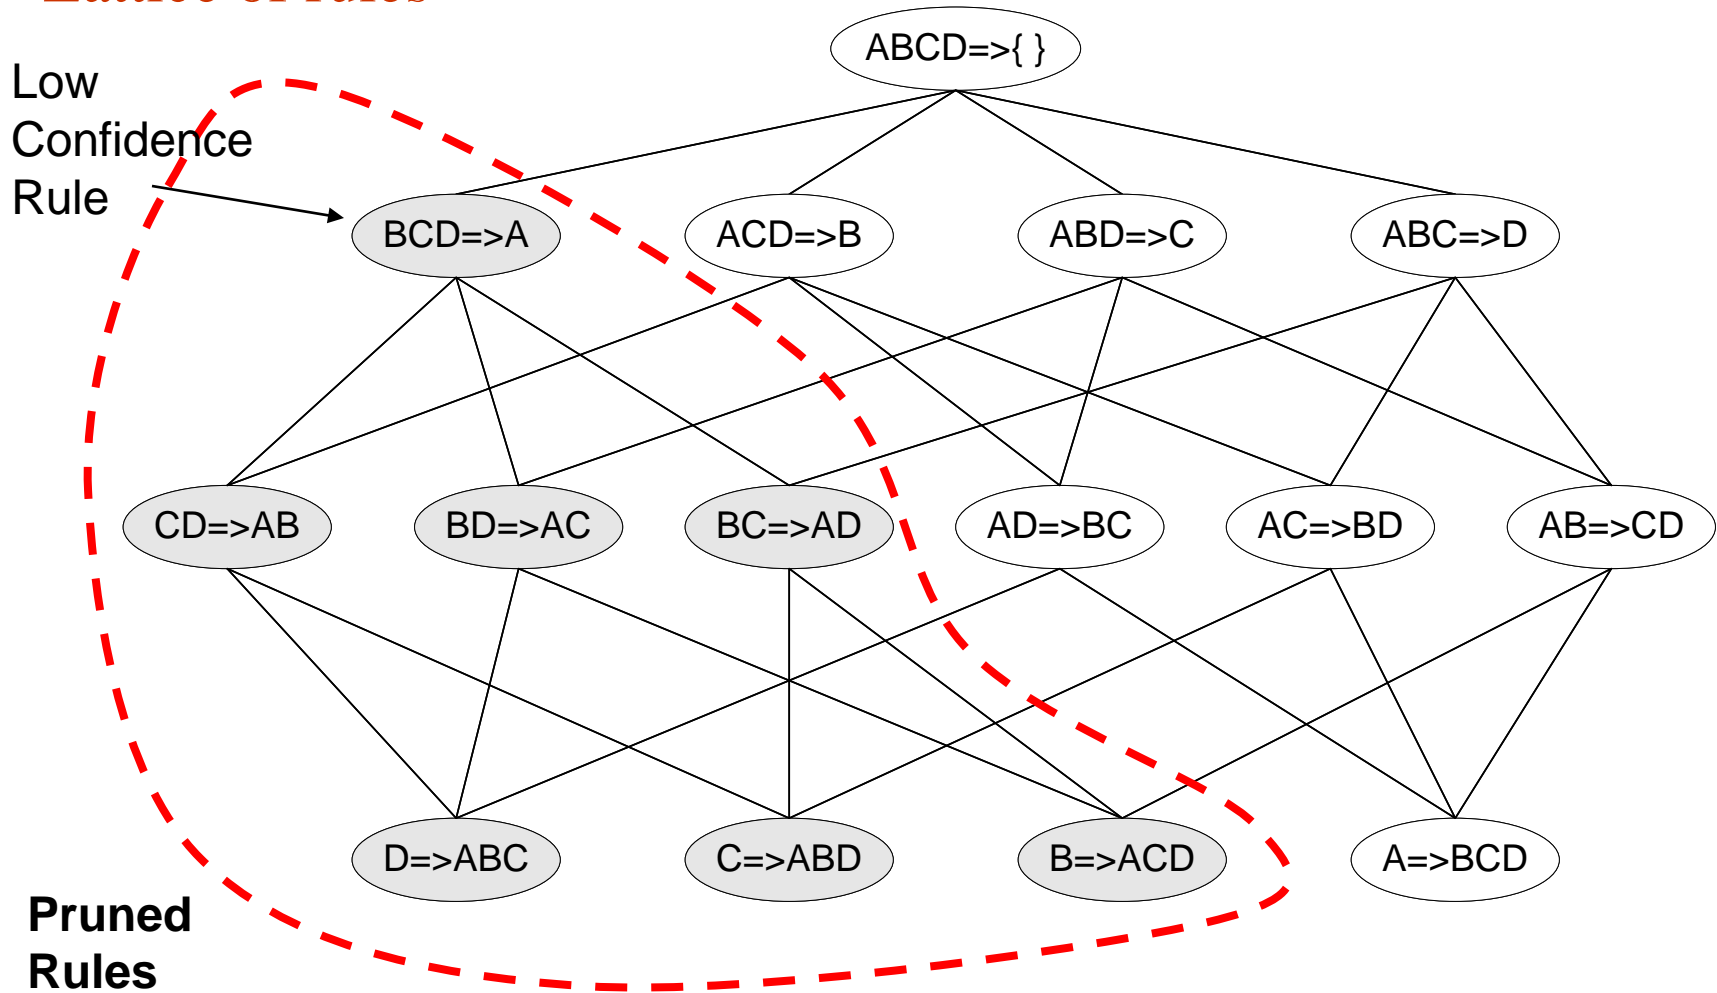

# Rule Generation

- How to efficiently generate rules from frequent itemsets?
  - In general, confidence does not have an anti-monotone property  
 $c(ABC \rightarrow D)$  can be larger or smaller than  $c(AB \rightarrow D)$
  - But confidence of rules generated from the same itemset has an anti-monotone property
  - e.g.,  $L = \{A, B, C, D\}$ :

$$c(ABC \rightarrow D) \geq c(AB \rightarrow CD) \geq c(A \rightarrow BCD)$$

# Rule Generation for Apriori Algorithm

## Lattice of rules

# Rule Generation for Apriori Algorithm

- Candidate rule is generated by merging two rules that share the same prefix in the rule consequent
- $\text{join}(\text{CD} \Rightarrow \text{AB}, \text{BD} \Rightarrow \text{AC})$  would produce the candidate rule  $\text{D} \Rightarrow \text{ABC}$
- Prune rule  $\text{D} \Rightarrow \text{ABC}$  if its subset  $\text{CD} \Rightarrow \text{AB}$  does not have high confidence

# Pattern Evaluation

---

- Association rule algorithms tend to produce too many rules
  - many of them are uninteresting or redundant
  - Redundant if  $\{A,B,C\} \rightarrow \{D\}$  and  $\{A,B\} \rightarrow \{D\}$  have same support & confidence
- Interestingness measures can be used to prune/rank the derived patterns
- In the original formulation of association rules, support & confidence are the only measures used

# Computing Interestingness Measure

- Given a rule  $X \rightarrow Y$ , information needed to compute rule interestingness can be obtained from a contingency table

Contingency table for  $X \rightarrow Y$

	Y	$\overline{Y}$	
X	$f_{11}$	$f_{10}$	$f_{1+}$
$\overline{X}$	$f_{01}$	$f_{00}$	$f_{0+}$
	$f_{+1}$	$f_{+0}$	$ T $

$f_{11}$ : support of X and Y

$f_{10}$ : support of  $\underline{X}$  and  $\overline{Y}$

$f_{01}$ : support of  $\overline{X}$  and  $\underline{Y}$

$f_{00}$ : support of  $\overline{X}$  and  $\overline{Y}$

Used to define various measures

□ support, confidence, lift, Gini, J-measure, etc.

# Drawback of Confidence

	Coffee	<u>Coffee</u>	
Tea	15	5	20
<u>Tea</u>	75	5	80
	90	10	100

Association Rule: Tea  $\rightarrow$  Coffee

- Confidence =  $P(\text{Coffee}|\text{Tea})$
- but  $P(\text{Coffee})$
- Although confidence is high, rule is misleading
- $P(\text{Coffee}|\overline{\text{Tea}})$  :

# Statistical-based Measures

---

- Measures that take into account statistical dependence

$$Lift = \frac{P(Y | X)}{P(Y)}$$

# Example: Lift/Interest

	Coffee	<u>Coffee</u>	
Tea	15	5	20
<u>Tea</u>	75	5	80
	90	10	100

Association Rule: Tea  $\rightarrow$  Coffee

Confidence =  $P(\text{Coffee}|\text{Tea}) = 0.75$

but  $P(\text{Coffee}) = 0.9$

$\Rightarrow \text{Lift} = 0.75/0.9 = 0.8333 (< 1, \text{ therefore is negatively associated})$

# Sequence Data

Sequence Database:

Object	Timestamp	Events
A	10	2, 3, 5
A	20	6, 1
A	23	1
B	11	4, 5, 6
B	17	2
B	21	7, 8, 1, 2
B	28	1, 6
C	14	1, 8, 7

# Sequence Data

Sequence Database	Sequence	Element (Transaction)	Event (Item)
Customer	Purchase history of a given customer	A set of items bought by a customer at time $t$	Books, diary products, CDs, etc
Web Data	Browsing activity of a particular Web visitor	A collection of files viewed by a Web visitor after a single mouse click	Home page, index page, contact info, etc
Event data	History of events generated by a given sensor	Events triggered by a sensor at time $t$	Types of alarms generated by sensors
Genome sequences	DNA sequence of a particular species	An element of the DNA sequence	Bases A,T,G,C

# Formal Definition of a Sequence

---

- A sequence is an ordered list of elements (transactions)

$$S = \langle e_1 e_2 e_3 \dots \rangle$$

- Each element contains a collection of events (items)

$$e_i = \{i_1, i_2, \dots, i_k\}$$

- Each element is attributed to a specific time or location
- Length of a sequence,  $|s|$ , is given by the number of elements of the sequence
- A  $k$ -sequence is a sequence that contains  $k$  events (items)

# Examples of Sequence

---

- Web sequence:

< {Homepage} {Electronics} {Digital Cameras} {Canon Digital Camera}  
{Shopping Cart} {Order Confirmation} {Return to Shopping} >

- Sequence of books checked out at a library:

<{Fellowship of the Ring} {The Two Towers} {Return of the King}>

# Formal Definition of a Subsequence

- A sequence  $\langle a_1 a_2 \dots a_n \rangle$  is contained in another sequence  $\langle b_1 b_2 \dots b_m \rangle$  ( $m \geq n$ ) if there exist integers  $i_1 < i_2 < \dots < i_n$  such that  $a_1 \subseteq b_{i_1}$ ,  $a_2 \subseteq b_{i_2}$ , ...,  $a_n \subseteq b_{i_n}$

Data sequence	Subsequence	Contain?
$\langle \{2,4\} \{3,5,6\} \{8\} \rangle$	$\langle \{2\} \{3,5\} \rangle$	Yes
$\langle \{1,2\} \{3,4\} \rangle$	$\langle \{1\} \{2\} \rangle$	No
$\langle \{2,4\} \{2,4\} \{2,5\} \rangle$	$\langle \{2\} \{4\} \rangle$	Yes

- The support of a subsequence  $w$  is defined as the fraction of data sequences that contain  $w$
- A *sequential pattern* is a frequent subsequence (i.e., a subsequence whose support is  $\geq \text{minsup}$ )

# Sequential Pattern Mining: Definition

---

- Given:
  - a database of sequences
  - a user-specified minimum support threshold, *minsup*
- Task:
  - Find all subsequences with support  $\geq \textit{minsup}$

# Sequential Pattern Mining: Challenge

- Given a sequence:  $\langle \{a\ b\} \{c\ d\ e\} \{f\} \{g\ h\ i\} \rangle$ 
  - Examples of subsequences:  
 $\langle \{a\} \{c\ d\} \{f\} \{g\} \rangle$ ,  $\langle \{c\ d\ e\} \rangle$ ,  $\langle \{b\} \{g\} \rangle$ , etc.
- How many  $k$ -subsequences can be extracted from a given  $n$ -sequence?

Answer :

$$\binom{n}{k} = \binom{9}{4} = 126$$

# Sequential Pattern Mining: Example

# Extracting Sequential Patterns

- Given  $n$  events:  $i_1, i_2, i_3, \dots, i_n$
- Candidate 1-subsequences:  
 $\langle \{i_1\} \rangle, \langle \{i_2\} \rangle, \langle \{i_3\} \rangle, \dots, \langle \{i_n\} \rangle$
- Candidate 2-subsequences:  
 $\langle \{i_1, i_2\} \rangle, \langle \{i_1, i_3\} \rangle, \dots, \langle \{i_1\} \{i_1\} \rangle, \langle \{i_1\} \{i_2\} \rangle, \dots, \langle \{i_{n-1}\} \{i_n\} \rangle$
- Candidate 3-subsequences:  
 $\langle \{i_1, i_2, i_3\} \rangle, \langle \{i_1, i_2, i_4\} \rangle, \dots, \langle \{i_1, i_2\} \{i_1\} \rangle, \langle \{i_1, i_2\} \{i_2\} \rangle, \dots,$   
 $\langle \{i_1\} \{i_1, i_2\} \rangle, \langle \{i_1\} \{i_1, i_3\} \rangle, \dots, \langle \{i_1\} \{i_1\} \{i_1\} \rangle, \langle \{i_1\} \{i_1\} \{i_2\} \rangle, \dots$

# Generalized Sequential Pattern (GSP)

---

- **Step 1:**

- Make the first pass over the sequence database  $D$  to yield all the 1-element frequent sequences

- **Step 2:**

Repeat until no new frequent sequences are found

- **Candidate Generation:**

- ◆ Merge pairs of frequent subsequences found in the  $(k-1)th$  pass to generate candidate sequences that contain  $k$  items

- **Candidate Pruning:**

- ◆ Prune candidate  $k$ -sequences that contain infrequent  $(k-1)$ -subsequences

- **Support Counting:**

- ◆ Make a new pass over the sequence database  $D$  to find the support for these candidate sequences

- **Candidate Elimination:**

- ◆ Eliminate candidate  $k$ -sequences whose actual support is less than *minsup*

# Candidate Generation

- Base case ( $k=2$ ):
  - Merging two frequent 1-sequences  $\langle\{i_1\}\rangle$  and  $\langle\{i_2\}\rangle$  will produce two candidate 2-sequences:  $\langle\{i_1\} \{i_2\}\rangle$  and  $\langle\{i_1 i_2\}\rangle$
- General case ( $k>2$ ):
  - A frequent  $(k-1)$ -sequence  $w_1$  is merged with another frequent  $(k-1)$ -sequence  $w_2$  to produce a candidate  $k$ -sequence if the subsequence obtained by removing the first event in  $w_1$  is the same as the subsequence obtained by removing the last event in  $w_2$ 
    - ◆ The resulting candidate after merging is given by the sequence  $w_1$  extended with the last event of  $w_2$ .
      - If the last two events in  $w_2$  belong to the same element, then the last event in  $w_2$  becomes part of the last element in  $w_1$
      - Otherwise, the last event in  $w_2$  becomes a separate element appended to the end of  $w_1$

# Candidate Generation Examples

---

- Merging the sequences  
 $w_1 = \langle \{1\} \{2\ 3\} \{4\} \rangle$  and  $w_2 = \langle \{2\ 3\} \{4\ 5\} \rangle$   
will produce the candidate sequence  $\langle \{1\} \{2\ 3\} \{4\ 5\} \rangle$  because the last two events in  $w_2$  (4 and 5) belong to the same element
- Merging the sequences  
 $w_1 = \langle \{1\} \{2\ 3\} \{4\} \rangle$  and  $w_2 = \langle \{2\ 3\} \{4\} \{5\} \rangle$   
will produce the candidate sequence  $\langle \{1\} \{2\ 3\} \{4\} \{5\} \rangle$  because the last two events in  $w_2$  (4 and 5) do not belong to the same element
- We do not have to merge the sequences  
 $w_1 = \langle \{1\} \{2\} \{3\} \rangle$  and  $w_2 = \langle \{1\} \{2,5\} \rangle$

# Mining Sequential Patterns with Timing Constraints

---

- Approach 1:
  - Mine sequential patterns without timing constraints
  - Postprocess the discovered patterns
- Approach 2:
  - Modify GSP to directly prune candidates that violate timing constraints
  - Question:
    - ◆ Does Apriori principle still hold?

# Apriori Principle for Sequence Data

Object	Timestamp	Events
A	1	1,2,4
A	2	2,3
A	3	5
B	1	1,2
B	2	2,3,4
C	1	1, 2
C	2	2,3,4
C	3	2,4,5
D	1	2
D	2	3, 4
D	3	4, 5
E	1	1, 3
E	2	2, 4, 5

Suppose:

$$x_g = 1 \text{ (max-gap)}$$

$$n_g = 0 \text{ (min-gap)}$$

$$\text{minsup} = 60\%$$

$$\langle \{2\} \{5\} \rangle \text{ support} = 40\%$$

but

$$\langle \{2\} \{3\} \{5\} \rangle \text{ support} = 60\%$$

Problem exists because of max-gap constraint

No such problem if max-gap is infinite
