# Independent and Dependent Samples.

- ❑ Two samples are **independent** if the sample values selected from **one population** are **not related to or somehow paired or matched** with the sample values selected from the other population.
- ❑ Two samples are **dependent** (or consist of **matched pairs**) if the members of one sample can be used to determine the members of the other sample. [Samples consisting of **matched pairs** (such as husband wife data) are **dependent**.

❑ In addition to **matched pairs of sample data, dependence** could also occur with samples related **through associations** such as **family members.**]

# Confidence Interval for $\mu_D = \mu_1 - \mu_2$ for Paired Observations

If  $\bar{d}$  and  $s_d$  are the **mean** and **standard deviation**, respectively, of the normally distributed differences of  **$n$  random pairs of measurements**, a  $100(1 - \alpha)\%$  confidence interval for  $\mu_D = \mu_1 - \mu_2$  is

$$\bar{d} - t_{(\alpha/2, n-1)} \frac{s_d}{\sqrt{n}} < \mu_d < \bar{d} + t_{(\alpha/2, n-1)} \frac{s_d}{\sqrt{n}}$$

Where,

$$s_d = \sqrt{\frac{\sum (d - \bar{d})^2}{n-1}} \text{ OR } s_d = \sqrt{\frac{1}{n(n-1)} \{n \sum_{i=1}^n d_i^2 - (\sum_{i=1}^n d_i)^2\}}$$

$$s_d^2 = \frac{\sum (d - \bar{d})^2}{n-1} \text{ OR } s_d^2 = \frac{1}{n(n-1)} \{n \sum_{i=1}^n d_i^2 - (\sum_{i=1}^n d_i)^2\}$$

$$d_i = x_{1i} - x_{2i} \text{ OR } d_i = x_{2i} - x_{1i}, \bar{d} = \frac{\sum_{i=1}^n d_i}{n}$$

$H_0$	Value of Test Statistic	$H_1$	Critical Region
$\mu = \mu_0$	$z = \frac{\bar{x} - \mu_0}{\sigma/\sqrt{n}}; \sigma \text{ known}$	$\mu < \mu_0$	$z < -z_\alpha$
		$\mu > \mu_0$	$z > z_\alpha$
		$\mu \neq \mu_0$	$z < -z_{\alpha/2} \text{ or } z > z_{\alpha/2}$
$\mu = \mu_0$	$t = \frac{\bar{x} - \mu_0}{s/\sqrt{n}}; v = n - 1, \sigma \text{ unknown}$	$\mu < \mu_0$	$t < -t_\alpha$
		$\mu > \mu_0$	$t > t_\alpha$
		$\mu \neq \mu_0$	$t < -t_{\alpha/2} \text{ or } t > t_{\alpha/2}$
$\mu_1 - \mu_2 = d_0$	$z = \frac{(\bar{x}_1 - \bar{x}_2) - d_0}{\sqrt{\sigma_1^2/n_1 + \sigma_2^2/n_2}}; \sigma_1 \text{ and } \sigma_2 \text{ known}$	$\mu_1 - \mu_2 < d_0$	$z < -z_\alpha$
		$\mu_1 - \mu_2 > d_0$	$z > z_\alpha$
		$\mu_1 - \mu_2 \neq d_0$	$z < -z_{\alpha/2} \text{ or } z > z_{\alpha/2}$
$\mu_1 - \mu_2 = d_0$	$t = \frac{(\bar{x}_1 - \bar{x}_2) - d_0}{s_p \sqrt{1/n_1 + 1/n_2}}; v = n_1 + n_2 - 2, \sigma_1 = \sigma_2 \text{ but unknown, } s_p^2 = \frac{(n_1 - 1)s_1^2 + (n_2 - 1)s_2^2}{n_1 + n_2 - 2}$	$\mu_1 - \mu_2 < d_0$	$t < -t_\alpha$
		$\mu_1 - \mu_2 > d_0$	$t > t_\alpha$
		$\mu_1 - \mu_2 \neq d_0$	$t < -t_{\alpha/2} \text{ or } t > t_{\alpha/2}$
$\mu_1 - \mu_2 = d_0$	$t' = \frac{(\bar{x}_1 - \bar{x}_2) - d_0}{\sqrt{s_1^2/n_1 + s_2^2/n_2}}; v = \frac{(s_1^2/n_1 + s_2^2/n_2)^2}{\frac{(s_1^2/n_1)^2}{n_1 - 1} + \frac{(s_2^2/n_2)^2}{n_2 - 1}}, \sigma_1 \neq \sigma_2 \text{ and unknown}$	$\mu_1 - \mu_2 < d_0$	$t' < -t_\alpha$
		$\mu_1 - \mu_2 > d_0$	$t' > t_\alpha$
		$\mu_1 - \mu_2 \neq d_0$	$t' < -t_{\alpha/2} \text{ or } t' > t_{\alpha/2}$
$\mu_D = d_0$ paired observations	$t = \frac{\bar{d} - d_0}{s_d/\sqrt{n}}; v = n - 1$	$\mu_D < d_0$	$t < -t_\alpha$
		$\mu_D > d_0$	$t > t_\alpha$
		$\mu_D \neq d_0$	$t < -t_{\alpha/2} \text{ or } t > t_{\alpha/2}$

# Testing Hypothesis about Paired Observation

a)  $H_o: \mu_d = 0$

$H_1: \mu_d < 0$  (One tailed test)

b)  $H_o: \mu_d = 0$

$H_1: \mu_d > 0$  (One tailed test)

c)  $H_o: \mu_d = 0$

$H_1: \mu_d \neq 0$  (Two tailed test)

# Test statistic:

$$t_{\text{cal}} = \frac{\bar{d} - \mu_d}{\frac{s_d}{\sqrt{n}}},$$

Where  $d_i = x_{1i} - x_{2i}$  OR  $d_i = x_{2i} - x_{1i}$

$$\bar{d} = \frac{\sum_{i=1}^n d_i}{n}$$

$$s_d = \sqrt{\frac{\sum (d_i - \bar{d})^2}{n-1}} \text{ OR}$$

$$s_d = \sqrt{\frac{1}{n(n-1)} \{n \sum_{i=1}^n d_i^2 - (\sum_{i=1}^n d_i)^2\}}$$

# The $t$ Test for Dependent Samples: An Example

Eight individuals indicated their attitudes toward socialized medicine before and after listening to a pro-socialized medicine lecture. Attitudes were assessed on a scale from 1 to 7, with higher scores indicating more positive attitudes. The attitudes before and after listening to the lecture were as indicated in the second and third columns of the table. Test for a relationship between the time of assessment and attitudes toward socialized medicine using a correlated groups  $t$  test.

Individual	Before speech	After speech
1	3	6
2	4	6
3	3	3
4	5	7
5	2	4
6	5	6
7	3	7
8	4	6

# Solution

$$\mu_D = 0$$

(Population mean)

$$n = 8$$

(Sample size)

$$\alpha = 0.05$$

(Level of significance)

$$\bar{d} = ?$$

$$s_d = ?$$

1. We state our hypothesis as:

$$H_o: \mu_d = 0$$

$$H_1: \mu_d \neq 0 \text{ (Two tailed test)}$$

2. The level of significance is set  $\alpha = 0.05$

3. Test statistic to be used is

$$t_{cal} = \frac{\bar{d} - \mu_d}{\frac{s_d}{\sqrt{n}}}$$

4. Calculations:

Before speech	After speech	$d_i = x_{1i} - x_{2i}$	$d^2_i$
3	6	-3	9
4	6	-2	4
3	3	0	0
5	7	-2	4
2	4	-2	4
5	6	-1	1
3	7	-4	16
4	6	-2	4
<b>Sum</b>		$\sum_{i=1}^n d_i = -16$	$\sum_{i=1}^n d^2_i = 42$

$$\bar{d} = \frac{\sum_{i=1}^n d_i}{n} = -16/2 = -2$$

$$s_d = \sqrt{\frac{1}{n(n-1)} \{n \sum_{i=1}^n d_i^2 - (\sum_{i=1}^n d_i)^2\}}$$

$$s_d = \sqrt{\frac{1}{8(8-1)} \{8(42) - (-16)^2\}} = \sqrt{\frac{80}{8(8-1)}} = 1.1952$$

$$t_{cal} = \frac{\bar{d} - \mu_d}{\frac{s_d}{\sqrt{n}}} = t_{cal} = \frac{-2 - 0}{\frac{1.1952}{\sqrt{8}}} = \frac{-2}{0.4226}$$

$$t_{cal} = -4.7326$$

$$|t_{cal}| = 4.7326$$

## 5. Critical region:

$$|t_{cal}| > t_{tab}, \text{ where } t_{tab} = t_{(\alpha/2, n-1)}$$

$$\text{Where } t_{tab} = t_{(\alpha/2, n-1)} = t_{(0.0250, 7)} = 2.365$$

6. **Conclusion:** Since calculated value of  $t_{cal}$  is greater than  $t_{tab}$ , so we reject  $H_0$

## Interpret your results.

After the **pro-socialized medicine lecture**, individuals' attitudes toward **socialized medicine** were significantly more positive than before the lecture.

# Analysis of variance (ANOVA)

□ **Analysis of variance (ANOVA)** is a method of testing the **equality of three or more population means** by analyzing **sample variances**.

# One-Way Analysis of Variance: Completely Randomized Design (One-Way ANOVA)

Random samples of size  $n$  are selected from each of  $k$  populations. The  $k$  different populations are classified on the basis of a single criterion such as different treatments or groups.

Today the term **treatment** is used generally to refer to the various classifications, whether they be different aggregates, different analysts, different fertilizers, or different regions of the country.

# Assumptions and Hypotheses in One-Way ANOVA

□ It is assumed that the  $k$  populations are **independent** and **normally distributed** with means  $\mu_1, \mu_2, \dots, \mu_k$  and **common variance**  $\sigma^2$ .

□ We wish to derive appropriate methods for testing the hypothesis

$$H_0: \mu_1 = \mu_2 = \dots = \mu_k$$

$H_1$ : At least two of the means are not equal

- Let  $y_{ij}$  denote the  $j$ th observation from the  $i$ th treatment and arrange the data as the table on next slide.
- Here,  $Y_i$  is the total of all observations in the sample from the  $i$ th treatment,  $\bar{y}_i$  is the mean of all observations in the sample from the  $i$ th treatment,
- $Y_{..}$  is the total of all  $n_k$  observations, and  $\bar{y}_{i..}$  is the mean of all  $n_k$  observations.

# ***k* Random Samples**

Treatment:	1	2	...	<i>i</i>	...	<i>k</i>	
	$y_{11}$	$y_{21}$	...	$y_{i1}$	...	$y_{k1}$	
	$y_{12}$	$y_{22}$	...	$y_{i2}$	...	$y_{k2}$	
	$\vdots$	$\vdots$		$\vdots$		$\vdots$	
	$y_{1n}$	$y_{2n}$	...	$y_{in}$	...	$y_{kn}$	
Total	$Y_{1.}$	$Y_{2.}$	...	$Y_{i.}$	...	$Y_{k.}$	$Y_{..}$
Mean	$\bar{y}_{1.}$	$\bar{y}_{2.}$	...	$\bar{y}_{i.}$	...	$\bar{y}_{k.}$	$\bar{y}_{..}$

# Sum-of-Squares Identity

$$\sum_{i=1}^k \sum_{j=1}^n (y_{ij} - \bar{y}_{..})^2 = n \sum_{i=1}^k (\bar{y}_{i.} - \bar{y}_{..})^2 + \sum_{i=1}^k \sum_{j=1}^n (y_{ij} - \bar{y}_{i.})^2$$

$$SST = \sum_{i=1}^k \sum_{j=1}^n (y_{ij} - \bar{y}_{..})^2 = \text{total sum of squares,}$$

$$SSA = n \sum_{i=1}^k (\bar{y}_{i.} - \bar{y}_{..})^2 = \text{treatment sum of squares,}$$

$$SSE = \sum_{i=1}^k \sum_{j=1}^n (y_{ij} - \bar{y}_{i.})^2 = \text{error sum of squares.}$$

$$\mathbf{SST = SSA + SSE.}$$

# Treatment Mean Square vs Error Mean Square (MSE)

□ Treatment Mean Square:

$$s^2 = \frac{SSA}{k - 1}$$

□ Error Mean Square (MSE):

$$s^2 = \frac{SSE}{k(n - 1)}$$

# Use of $F$ -Test in ANOVA

- ❑ The **estimate  $s^2$**  is **unbiased** regardless of the truth or falsity of the null hypothesis.
- ❑ It is important to note that the **sum-of-squares** identity has **partitioned** not only the **total variability of the data**, but also the **total number of degrees** of freedom.  
That is,  **$nk - 1 = k - 1 + k(n - 1)$** .

# **$F$ -Ratio for $s^2$ Testing Equality of Means**

- When  $H_0$  is **true**, the ratio  $f_{cal} = \frac{s_1^2}{s^2}$  is a value of the random variable  $F$  having the  **$F$ -distribution** with  **$k-1$**  and  **$k(n-1)$**  degrees of freedom.
- Since  $s_1^2$  overestimates  $\sigma^2$  when  $H_0$  is **false**, we have a one-tailed test with the critical region entirely in the right tail of the distribution.
- The **null hypothesis  $H_0$**  is rejected at the  $\alpha$ -level of significance when  **$f_{cal} > f_{\alpha}[k-1, k(n-1)]$** .

# Analysis of Variance for the One-Way ANOVA

Source of Variation	Sum of Squares	Degrees of Freedom	Mean Square	Computed $f$
Treatments	$SSA$	$k - 1$	$s_1^2 = \frac{SSA}{k - 1}$	$\frac{s_1^2}{s^2}$
Error	$SSE$	$k(n - 1)$	$s^2 = \frac{SSE}{k(n - 1)}$	
Total	$SST$	$kn - 1$		

**Example 13.1:** Test the hypothesis  $\mu_1 = \mu_2 = \cdots = \mu_5$  at the 0.05 level of significance for the data of Table 13.1 on absorption of moisture by various types of cement aggregates.

Table 13.1: Absorption of Moisture in Concrete Aggregates

Aggregate:	1	2	3	4	5

Mean	553.33	569.33	610.50	465.17	610.67	561.80

## ***Solution:***

1. We state our hypothesis as

$$H_0: \mu_1 = \mu_2 = \cdots = \mu_5$$

$H_1$ : At least two of the means are not equal

2. The level of significance is set  $\alpha = 0.05$ .

3. Test statistic to be used is

$$f_{cal} = \frac{s_1^2}{s^2}$$

4. Calculations:

# Formulae

1.  $SST = \sum_{i=1}^k \sum_{j=1}^n (y_{ij} - \bar{y}_{i..})^2 = \text{total sum of squares}$

2.  $SSA = n \sum_{i=1}^k (\bar{y}_{i.} - \bar{y}_{i..})^2 = \text{treatment sum of squares}$

3.  $SSE = \sum_{i=1}^k \sum_{j=1}^n (y_{ij} - \bar{y}_{i.})^2 = \text{error sum of squares}$

<b>60669.33</b>	<b>11513.33</b>	<b>17967.5</b>	<b>16592.83</b>	<b>17277.33</b>

$$\begin{aligned}
 \text{SSE} &= \sum_{i=1}^k \sum_{j=1}^n (y_{ij} - \bar{y}_{i.})^2 \\
 &= 60669.33 + 11513.33 + 17967.5 \\
 &\quad + 16592.83 + 17277.33 \\
 &= \mathbf{124020.3}
 \end{aligned}$$

$$\text{SSE} = \sum_{i=1}^k \sum_{j=1}^n (y_{ij} - \bar{y}_{i.})^2 = \text{error sum of squares}$$

$$\begin{aligned}
 \text{SST} &= \text{SSA} + \text{SSE} \\
 &= 85075.7922 + 124020.3 \\
 &= \mathbf{209096.0922}
 \end{aligned}$$

# Method 2

We can first find **SSA**. Then we can find **SST** using formula given below:

$$\mathbf{SST = \sum_{i=1}^k \sum_{j=1}^n (y_{ij} - \overline{y_{i..}})^2 = \text{total sum of squares}}$$

After finding **SSA** and **SST**, we will use the following formula to find **SSE**:

$$\mathbf{SST = SSA + SSE}$$

$$\Rightarrow \mathbf{SSE = SST - SSA}$$

# Analysis of Variance for the One-Way

Source of Variation	Sum of Squares	Degree of Freedom	Mean Square	Calculated f
Treatments	SSA = 209377	$k - 1 = 5 - 1 = 4$	$s_1^2 = \frac{SSA}{k - 1}$ $= \frac{209377}{4}$ $= 21339.1167$	$f_{cal} = \frac{s_1^2}{s^2}$ $= \frac{21339.1167}{4960.8133}$ $= 4.30$
Error	SSE = 124021	$k(n - 1) = 5 (6-1) = 25$	$s^2 = \frac{124021}{25}$ $= 4960.8133$	
Total	SST = 209096.0922	$kn - 1$ $= (5)(6) - 1$ $= 29$		

5. Critical region:

$$f_{cal} > f_{\alpha}[k - 1, k(n - 1)]$$

$$f_{tab} = f_{\alpha}[k - 1, k(n - 1)] = f_{0.05}[4, 25] \\ = 2.76$$

$$4.30 > 2.76$$

**6. Conclusion: Reject  $H_0$**
