Readings for these lecture notes:

☐ Probability & Statistics for Engineers & Scientists, Ninth edition, Ronald E. Walpole, Raymond H. Myer

☐ Elementary Statistics, Tenth Edition, Mario F. Triola

These notes contain material from the above resources.

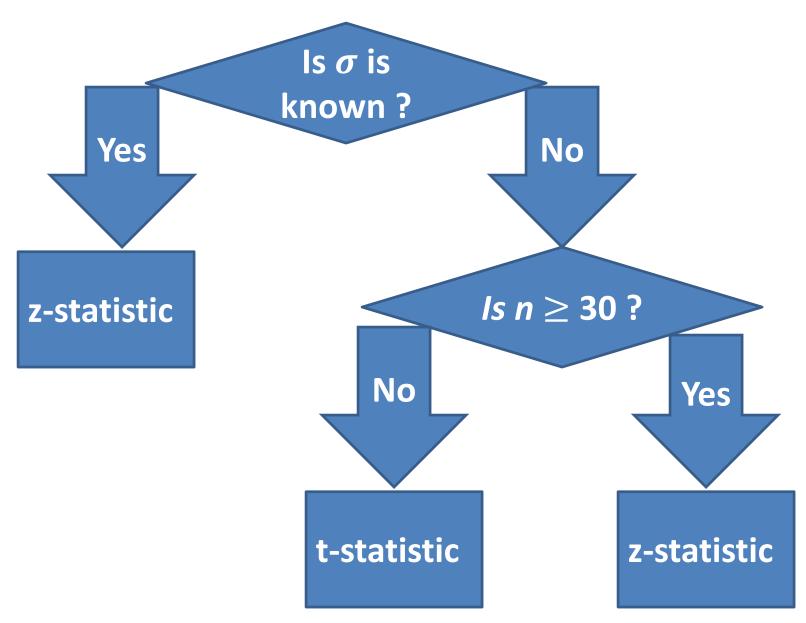

Is σ is known?

Yes

No

If either the population is normally distributed or $n \ge 30$, then use the use the standard normal distribution or Z-test

If either the population is normally distributed or $n \ge 30$, then use the t-distribution or t-test

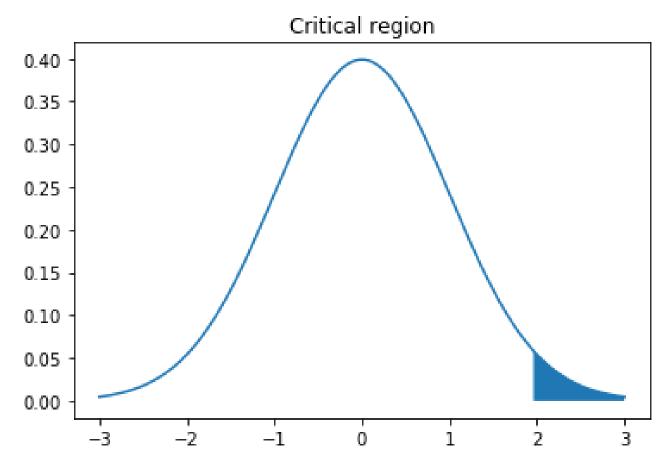

Dr. Faisal Bukhari, PUCIT, PU, Lahore

When both n < 30 and the population is not normally distributed, we cannot use the standard normal distribution or the t-distribution.

Critical Region: Scenario 1

 H_1 : $\mu > \mu_0$ (One tailed test)

 $Z_{cal} > Z_{tab}$, where $Z_{tab} = Z_{\alpha}$

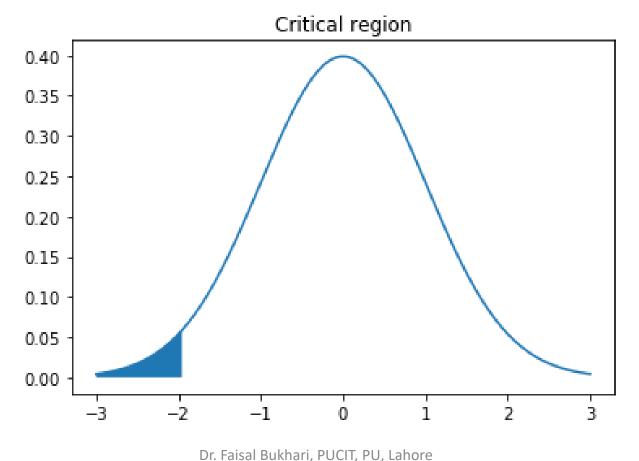

Dr. Faisal Bukhari, PUCIT, PU, Lahore

Critical Region: Scenario 2

 H_1 : $\mu < \mu_0$ (One tailed test)

 $Z_{cal} < Z_{tab}$, where $Z_{tab} = -Z_{\alpha}$

Critical Region: Scenario 3

 H_1 : $\mu \neq \mu_0$ (Two tailed test)

$$|Z_{cal}| > Z_{tab}$$
, where $Z_{tab} = Z_{\alpha/2}$

Approach to Hypothesis Testing with Fixed Probability of Type I Error

- 1. State the null and alternative hypotheses.
- 2. Choose a fixed significance level α .
- 3. Test statistic to be used it
- 4. Calculations
- 5. Critical region
- 6. Conclusion

Area under the Normal Curve [1]

Two Samples: Tests on Two Means

Example: An experiment was performed to compare the abrasive wear of two different laminated materials. Twelve pieces of material 1 were tested by exposing each piece to a machine measuring wear. **Ten** pieces of material 2 were similarly tested. In each case, the depth of wear was observed. The samples of material 1 gave an average (coded) wear of 85 units with a sample standard deviation of 4, while the samples of material 2 gave an average of 81 with a sample standard deviation of 5. Can we conclude at the 0.05 level of significance that the abrasive wear of material 1 exceeds that of material 2 by more than 2 units? Assume the populations to be approximately normal with equal variances.

Dr. Faisal Bukhari, PUCIT, PU, Lahore

Solution:

$$n_1 = 12$$
 (Sample size of material 1)

$$\overline{x_1} = 85$$
 (Sample mean of material 1)

$$s_1 = 4$$
 (sample standard deviation of material 1)

$$n_2 = 10$$
 (Sample size of material 2)

$$\overline{x_2} = 81$$
 (Sample mean of material 2)

$$s_2 = 5$$
 (sample standard deviation of material 1)

$$\alpha = 0.05$$
 (Level of significance

Given assumption the populations to be approximately normal with equal variances

$$\Rightarrow \sigma_1^2 = \sigma_1^2$$
 but unknown

1. We state our hypothesis as:

$$H_0$$
: $\mu_1 - \mu_2 = 2$

$$H_1$$
: $\mu_1 - \mu_2 > 2$

(One tailed test)

- 2. The level of significance is set $\alpha = 0.05$.
- 3. Test statistic to be used is

$$t_{cal} = \frac{(\overline{x_1} - \overline{x_2}) - (\mu_1 - \mu_2)}{s_p \sqrt{1/n_1 + 1/n_2}}$$

where, sp=
$$\sqrt{\frac{(n_1 - 1)s_1^2 + (n_2 - 1)s_2^2}{n_1 + n_2 - 2}}$$

$$S_1^2 = \frac{\sum (x_1 - \overline{x_1})^2}{n_1 - 1}$$
Dr. Faisal Bukhari, Pucit, Pu, Lai

$$S_2^2 = \frac{\sum (x_2 - \overline{x_2})^2}{n_2 - 1}$$

4. Calculations:
$$s_p = \sqrt{\frac{(12-1)4^2 + (10-1)5^2}{12+10-2}} = 4.478$$

$$t_{cal} = \frac{(85 - 81) - 2}{4.478\sqrt{1/12 + 1/10}} = 1.04$$

5. Critical region:

$$t_{cal} > t_{tab}$$

Where
$$t_{tab} = t_{(\alpha, n1 + n2 - 2)} = t_{(0.05, 20)} = 1.725$$

6. Conclusion: Since calculated value of t_{cal} is less than the tabulate value of t, so we accept H_{o}

Two Samples: Tests on Two Means

Example: An experiment was performed to compare the abrasive wear of two different laminated materials. Twelve pieces of material 1 were tested by exposing each piece to a machine measuring wear. Ten pieces of material 2 were similarly tested. In each case, the depth of wear was observed. The samples of material 1 gave an average (coded) wear of 85 units with a sample standard deviation of 4, while the samples of material 2 gave an average of 81 with a sample standard deviation of 5.

Cont.

Can we conclude at the **0.05** level of significance that the abrasive wear of material 1 exceeds that of material 2 by more than 2 units? Assume the populations to be approximately normal with **unequal variances**.

Solution:

```
n_1 = 12 (Sample size of material 1)

\overline{x_1} = 85 (Sample mean of material 1)

s_1 = 4 (sample standard deviation of material 1)

n_2 = 10 (Sample size of material 2)

\overline{x_2} = 81 (Sample mean of material 2)

s_2 = 5 (sample standard deviation of material 1)

\alpha = 0.05 (Level of significance
```

Given assumption the populations to be approximately normal with unequal variances

$$\Rightarrow \sigma_1^2 \neq \sigma_1^2$$
 but unknown

1. We state our hypothesis as:

$$H_0$$
: $\mu_1 - \mu_2 = 2$

$$H_1$$
: $\mu_1 - \mu_2 > 2$

(One tailed test)

- 2. The level of significance is set $\alpha = 0.05$.
- 3. Test statistic to be used is

$$t_{cal} = \frac{(\overline{x_1} - \overline{x_2}) - (\mu_1 - \mu_2)}{\sqrt{\frac{S_1^2}{n_1} + \frac{S_2^2}{n_2}}}$$

where
$$s_1^2 = \frac{\sum (x_1 - \overline{x_1})^2}{n_1 - 1}$$
 and $s_2^2 = \frac{\sum (x_2 - \overline{x_2})^2}{n_2 - 1}$

4. Calculations:
$$t_{cal} = \frac{(85 - 81) - 2}{\sqrt{4^2/12 + 5^2/10}} = 2/1.8708 = 1.0691$$

Dr. Faisal Bukhari, PUCIT, PU, Lahore

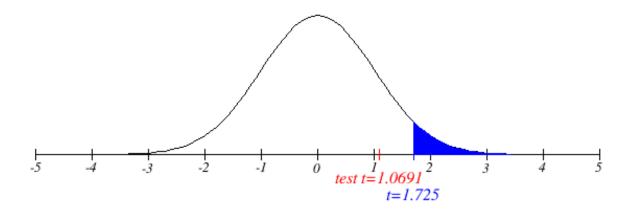

5. Critical region:

$$\begin{split} &t_{cal} > t_{tab} \\ &\text{where } t_{tab} = t_{(\alpha,\,\nu)} \\ &v = \frac{(s_1^{\,2}/n_1 + s_2^{\,2}/n_2)^2}{[(s_1^{\,2}/n_1)^2/(n_1-1) + (s_2^{\,2}/n_2)^2/(n_2-1)]} \\ &v = \frac{(4^2/12 + 5^2/10)^2}{[(4^2/12)^2/11 + (5^2/10)^2/9]} \\ &v = 16.6944/(0.1616 + 0.6944) = 19.5028 = 20 \\ &t_{(\alpha,\,\nu)} = t_{(0.05,\,20)} = \textbf{1.725} \end{split}$$

$$t_{cal} = 1.0691$$

$$t_{cal} < t_{tab}$$

1.0691 < 1.725

$$t_{cal} = 1.0691$$

$$t_{cal} < t_{tab}$$

1.0691 < 1.725

6. Conclusion: Since calculated value of t_{cal} is less than the tabulate value of t, so we accept H_O

1. When $\alpha = 0.05$ or $\alpha = 5\%$

$$z_{\alpha/2} = z_{0.0250} = 1.96$$
 :: 1 - $\alpha/2 = 1 - 0.250 = 0.9750$

2. When $\alpha = 0.01$ or $\alpha = 1\%$

$$z_{\alpha/2} = z_{0.005} = 2.575$$
 $\therefore 1 - \alpha/2 = 1 - 0.005 = 0.9950$

3. When $\alpha = 0.10$ or $\alpha = 10\%$

$$z_{\alpha/2} = z_{0.05} = 1.645$$
 $\therefore 1 - \alpha/2 = 1 - 0.05 = 0.9500$

Testing a Proportion

- 1. H_0 : $p = p_0$.
- One of the alternatives H_1 : $p < p_0$, $p > p_0$, or $p \neq p_0$.
- 2. Choose a level of significance equal to α .
- 3. Test statistic: Binomial variable X with $p = p_0$.

$$Z_{cal} = \frac{x - np_0}{\sqrt{np_0q_0}}$$
 or $Z_{cal} = \frac{\hat{p} - p_0}{\sqrt{p_0q_0/n}}$

Where p_0 is the population proportion and \widehat{p} is the sample proportion

- 4. Computations: Find x, the number of successes, and compute the appropriate P-value.
- 5. Decision: Draw appropriate conclusions based on the *P*-value.

 Dr. Faisal Bukhari, PUCIT, PU, Lahore

Example: A **builder claims** that heat pumps are installed in **70%** of all homes being constructed today in the city of Richmond, Virginia. Would you **agree with this claim** if a **random survey** of new homes in this city showed that **8 out of 15** had heat pumps installed? Use a **0.10 level of significance**.

Solution:

p or
$$p_0 = 0.70$$

 $\hat{p} = x/n = 8/15 = 0.53$
 $\hat{q} = 1 - 0.53 = 0.47$
 $n=15$

(population proportion) (sample proportion)

1. We state our hypothesis as

$$H_0$$
: p = 0.7.

$$H_1$$
: p \neq 0.7 (two tailed test)

- 2. The level of significance is set at $\alpha = 0.10$.
- 3. Test statistic to be used is:

$$Z_{cal} = \frac{\widehat{p} - p_0}{\sqrt{p_0 q_0/n}}$$

4. Calculations:

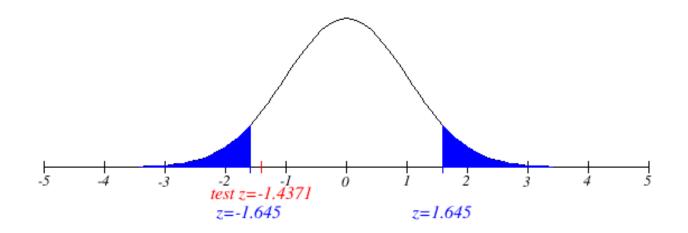

$$\mathbf{Z_{cal}} = \frac{0.53 - 0.70}{\sqrt{0.70(0.30)/15}}$$

$$= -0.17/0.1183 = -1.4371$$

5. Critical region:

$$|Z_{cal}| > Z_{tab}$$

Where $Z_{tab} = Z_{\alpha/2} = Z_{0.05} = 1.645$

6. Conclusion: Since calculated value of Z is less than the tabulated value of Z, so we accept H_o and conclude that there is insufficient reason to doubt the builder's claim.

Example: A commonly prescribed drug for relieving nervous tension is believed to be only **60% effective**. Experimental results with a new drug administered to a random sample of **100 adults** who were suffering from nervous tension show that **70 received relief**. Is this sufficient evidence to conclude that the new drug is **superior** to the one **commonly prescribed**? Use a 0.05 level of significance.

Solution:

p or
$$p_0 = 0.60$$

(population proportion)

$$\hat{p} = x/n = 70/100 = 0.70$$

(sample proportion)

$$\hat{q} = 1 - 0.70 = 0.30$$

$$n = 100$$

(sample size)

1. We state our hypothesis as

$$H_0$$
: p = 0.60

$$H_1$$
: p > 0.60 (one tailed test)

- 2. The level of significance is set at $\alpha = 0.05$.
- 3. Test statistic to be used is:

$$Z_{cal} = \frac{\widehat{p} - p_0}{\sqrt{p_0 q_0/n}}$$

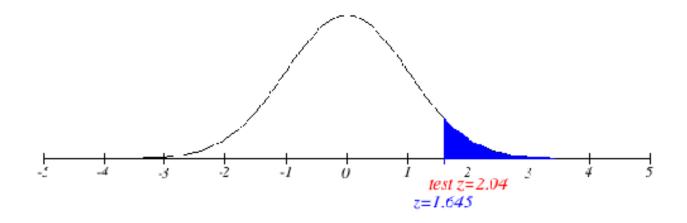

4. Calculations:

$$Z_{cal} = \frac{0.70 - 0.60}{\sqrt{(0.60)(0.40)/10}} = 2.04$$

5. Critical region:

$$Z_{cal} > Z_{tab}$$

Where $Z_{tab} = Z_{\alpha} = Z_{0.05} = 1.645$

6. Conclusion: Since calculated value of Z is greater than the tabulated value of Z, so we reject H_0 .

Two Samples: Tests on Two Proportions

$$Z_{cal} = \frac{(\hat{p}_1 - \hat{p}_2) - (p_1 - p_2)}{\sqrt{P_c q_c (\frac{1}{n_1} + \frac{1}{n_2})}}$$

where
$$p_c = \frac{x_1 + x_2}{n_1 + n_2}$$
 and $q_c = 1 - p_c$

Where p_1 and p_2 are the population proportion from population 1 and population 2 and $\widehat{p_1}$ and $\widehat{p_2}$ are the corresponding respective sample proportions.

Example: A vote is to be taken among the residents of a town and the surrounding county to determine whether a proposed chemical plant should constructed. The construction site is within the town limits, and for this reason many voters in the county believe that the proposal will pass because of the large proportion of town voters who favor the construction. To determine if there is a significant difference in the proportions of town voters and county voters favoring the proposal, a poll is taken. If 120 of 200 town voters favor the proposal and 240 of 500 county residents favor it, would you agree that the proportion of town voters favoring the proposal is higher than the **proportion of county voters?** Use an $\alpha = 0.05$ level of significance. Dr. Faisal Bukhari, PUCIT, PU, Lahore

Solution:

$$\widehat{\mathbf{p}_1} = x_1/n_2 = 120/200 = 0.60$$
 (sample proportion of town voters, favoring it)

$$\hat{\mathbf{q_1}} = 1 - 0.60 = 0.40$$

 $n_1 = 100$ (sample size of town voters)

$$\widehat{\mathbf{p_2}} = x_2/n_2 = 240/500 = 0.60$$
 (sample proportion of county residents, favoring it)

$$\hat{\mathbf{q}_2} = 1 - 0.60 = 0.40$$

 n_2 = 100 (sample size of county residents)

$$\mathbf{p_c} = \frac{\mathbf{x_1} + \mathbf{x2}}{\mathbf{n_1} + \mathbf{n2}} = (120 + 240)/(200 + 500) = 0.51$$

and
$$q_c = 1 - p_c = 0.49$$

1. We state our hypothesis as

$$H_0$$
: $p_1 = p_2$
 H_1 : $p_1 > p_2$ (one tailed test)

- 2. The level of significance is set at $\alpha = 0.05$.
- 3. Test statistic to be used is:

$$Z_{cal} = \frac{(\widehat{p}_1 - \widehat{p}_2) - (p_1 - p_2)}{\sqrt{P_c q_c (\frac{1}{n_1} + \frac{1}{n_2})}} \text{ where } p_c = \frac{x_1 + x_2}{n_1 + n_2}, \text{ and } q_c = 1 - \frac{x_1 + x_2}{n_1 + n_2}$$

 p_c

4. Calculations:

$$Z_{cal} = \frac{(0.60 - 0.48) - 0}{\sqrt{(0.51)(0.49)(\frac{1}{200} + \frac{1}{500})}} = 2.9$$

5. Critical region:

$$Z_{cal} > Z_{tab}$$
, where $Z_{tab} = Z_{\alpha} = Z_{0.05} = 1.645$

6. **Conclusion:** Since calculated value of Z is greater than the tabulated value of Z, so we reject H_o agree that the proportion of town voters favoring the proposal is higher than the proportion of county voters.
